Updates and insights for electric cooperatives considering or operating rural broadband networks.

False Flags and the FCC's Broadband Map

What do a Mexican restaurant, a Baptist Church, an orthodontist's office, and a school bus barn have in common?

I'll take suggestions for a good punchline. Unfortunately, all I've got is this: when we submitted these types of establishments as broadband serviceable locations (BSL) in rural Georgia, they were rejected.

- **Across the country**, restaurants, car dealers, shops, grocery stores, pharmacies, independent schools, rural libraries, and countless small businesses were rejected.

- **They are not part of the location fabric**, which is defined as locations that could receive mass market broadband.

The bottom line:

These hundreds of thousands, perhaps millions, of locations will not appear on the FCC's new broadband maps.

According to the FCC: *“The locations in the Fabric that have a BSL Flag of “False” are structures that have or should have broadband service but likely do not take or would not take mass market service (and therefore do not fall within the definition of a BSL) based on available data. Examples of such locations include certain Community Anchor Institutions and large enterprises.”*

Background

About a decade ago, when the FCC staff were putting together cost models for building fiber networks, a determination was made not to include large businesses in the calculations.

- **Even though fiber would be built to large businesses**, the FCC assumed that such business could pay for dedicated access and thus would not need to be part of the modeling process.
- **Schools and libraries and health care institutions** had their own funding programs, so these, too, were excluded.
- **Thus, only housing units and small businesses** were considered as part of the modeling process.

Why it matters:

The FCC's consultant for the cost model, CostQuest, did not possess a database of the locations of all small businesses in the country. It licensed such a database, which turned out to be wildly inaccurate and distorted the CAF and RDOF programs. But that's another topic for another time.

For the Broadband Location Fabric, the FCC once again chose CostQuest, this time to map the locations for the **new broadband maps**. Once again, the decision was made to exclude large enterprises and community anchor institutions.

Once again, CostQuest, not possessing such a database, licensed one. Businesses with a certain number of employees are treated as large enterprises and the location fabric excludes such businesses from the broadband map.

Yes, but:

There is a flaw in the way the data is being used. The dataset aggregates all employees at every location and counts individual locations as one large enterprise.

- Effectively, each restaurant in a chain is treated as if every employee works in every restaurant.
 - Each branch in a bank is treated as if every employee works in every branch.
-

- You get the idea. **Every small part of a chain is treated as if it were a large enterprise. The result is these locations are excluded from the location fabric.**

Go Deeper

It makes sense to exclude large enterprises from the calculations of rural broadband, right? And to follow the same approach with the new location-based broadband map, right?

Wrong.

Hundreds of thousands of data points wrong. Maybe millions of data points wrong. According to the FCC, “While these locations may subscribe to mass-market services in some instances, we currently lack data that would enable us to make reliable determinations of when this is the case.”

Such an approach is exactly wrong for businesses in rural America.

To provide a concrete example, I am once again going to share results from queries into the location fabric. And, once again, inexplicably, **the public does not have access to this data.**

Baxley, Georgia. Baxley is the county seat in rural Appling County, with a population of 4,942 according to the 2020 Census.

1. We found **54 locations in Baxley that are not counted** under the FCC's approach to mapping.
2. Retail shops, restaurants, independent schools, churches, small business offices – most of which would likely take a mass market service, especially the Gigabit and multi-Gigabit services offered by fiber optic networks.
3. The broad assumption by the FCC that every business establishment in rural America would buy dedicated internet access is passing strange.

FALSE in the table below has the meaning ascribed to it in the location fabric, as in **not** a broadband serviceable location under the Infrastructure Act. Congress punted the definition of the BSL to the FCC. Even though Congress deferred to the FCC, I'd be surprised if any member of Congress meant that a black Baptist church or a small store or restaurant in a rural area should not be counted. (Are any rural members of Congress paying attention?)

Why it Matters:

Does it matter whether 40 or 50 locations in every rural town and rural community are missed by the FCC in the broadband map?

- **If one's focus for mapping** are the 140 million or so locations mostly in urban and dense suburban areas, probably not.
- **But since the first use of this map** is the determination of unserved locations, mostly in rural areas, certainly it matters.

- **We have already found** that the location fabric misses more than 10 percent of rural locations on farms and trailer parks and new subdivisions ([See FYI edition dated 8/12/22](#)).

The Final Word

Excluding nearly every small business in rural America is a big deal. If you're counting locations in rural America and you undercount farms and trailer homes and exclude small businesses, you're missing the most underserved segments of the most underserved parts of the country.

Such an approach will distort the true picture of broadband availability in rural America and distort the funding allocation.

When we asked whether the FCC would correct its errors, we were told to submit challenges. The FCC has neither the time, nor the capacity to

adjudicate hundreds of thousands of challenges. The flaws are systemic and should not depend on the challenge process.

Sight unseen, NTIA has already decided that it cannot use the first iteration of the FCC's maps for the BEAD allocation. Thus there is time to correct this fundamental flaw in the FCC's approach to rural small businesses and anchor institutions.
